1. The table shows people with diverse age group and education background, coming from all parts of the country. The dataset includes students and married people who have a particular credit rating along with number of cars which they have. The dataset also provides us with details like their income and debt balance of the credit card.

4.

Mean income = "=AVERAGE(A2:A401)" – 45.21889

First Quartile – "=QUARTILE(A2:A401, 1)" – 21.00725

Second Quartile – "=QUARTILE(A2:A401, 2)" – 33.1155

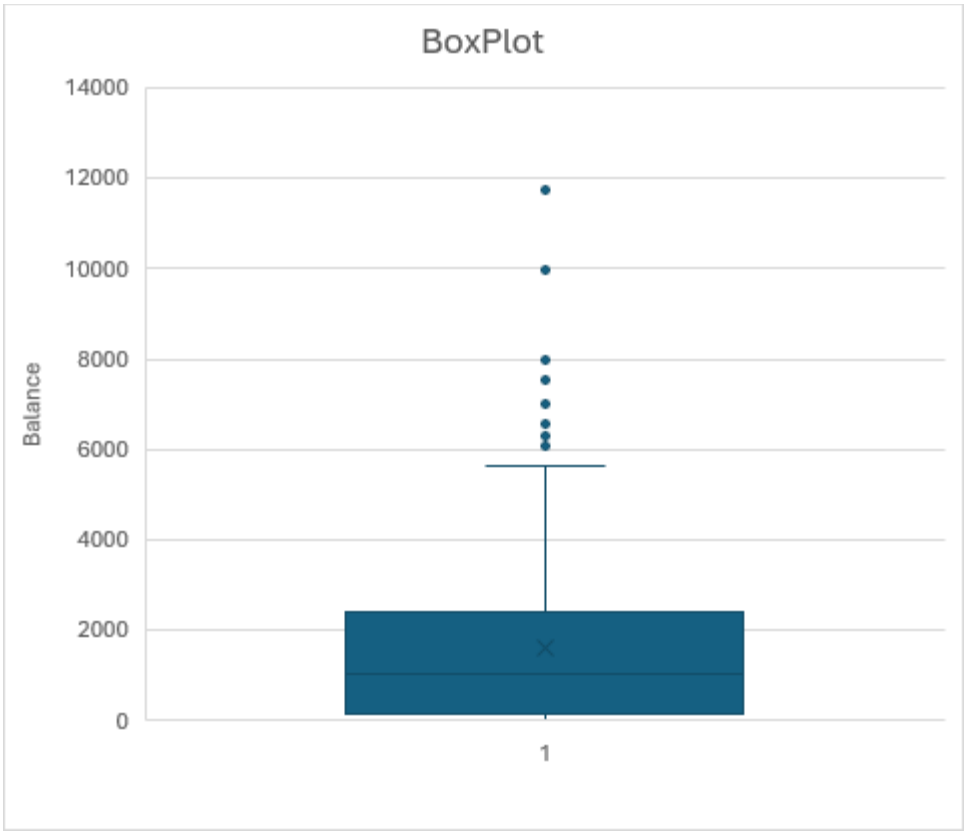

Third Quartile - "=QUARTILE(A2:A401, 3)" – 57.47075

5.

Standard Deviation of Income - 35.24427

IQR Income – "=QUARTILE(A2:A401, 3) - QUARTILE(A2:A401, 1)" - 36.4635

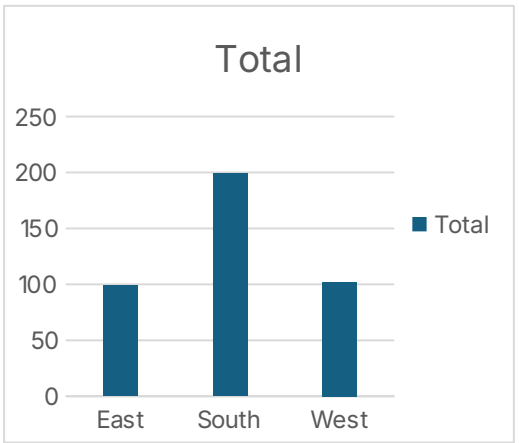

The standard deviation and IQR differ by 0.8 which means that outliers are not distorting the spread as such. The spread is consistent and data is fairly symmetrical.

6. 

The “X” mark is above the median line which shows that the chart is Right Skewed. Most of the people in the data have low balance and only a few people have very high ones. A small portion of people have extremely high balances as well.

7.
