SMDM – Assignment 2

Zwigato Delivery Simulation

Estimating P(Delay | Complaint) via Bayes theorem and Simulation in Excel

- By
  Naman Jain
  FT272022

Problem Setup and Parameters

Roll number Last Digit – 2, x=10

P (Complaint | On time) = 0.10

Zwigato, a food delivery platform, wants to understand the relationship between delivery delays and customer complaints. The objective is to find to what extent does a customer complaint indicate that an order was actually delayed.

Given parameters –

P(Delay)	**10.00%**	**0.10**
P(On Time) = 1 − P(Delay)	**90.00%**	**0.90**
P(Complaint | Delay)	**70.00%**	**0.70**
P(Complaint | On Time)	**10.00%**	**0.10**

Calculation –

P (Complaint) = P (C|D) x P (D) + P (C|O) x P(O)

= (0.7) x (0.1) + (0.1) x (0.9)

= 0.16

P (Delay | C) = P (C|D) x P (D) / P (C)

= 0.07 / 0.16

= 0.4375

The simulation in the excel uses Excel's RAND() function.

RAND() function is used for the simulation sheets in Column C and Column E.

Sheet	Columns	Formula used

Simulation Results –

Simulation Results — P(Delay | Complaint) across Trial Sizes

RESULTS TABLE						
Trial Size	**Total Complaints**	**Delayed & Complained**	**P(Delay|Complaint)**	**Hard Coded E column**	**Theoretical (Bayes)**	**Error**
100	26	17	**0.6538**	0.6538	**0.4375**	0.2163
5,000	858	382	**0.4452**	0.4400	**0.4375**	0.0077
20,000	3,115	1,346	**0.4321**	0.4266	**0.4375**	0.0054
Theoretical — Bayes' Rule			**0.4375**		—	—

Visualisation –

The chart above shows that the estimate of P (D|C) with Number of trials.

Trail size is 100, there is high deviation of 0.2163 due to very few complaint events of 26 in total. Random noise dominates at small sample sizes.

Trail size is 5000, the deviation narrows to 0.0077 as complaint events of 858 are observed. Estimate is stabilising

Trail size is 20000, the deviation is minimal of 0.0054.

Excel Link - https://docs.google.com/spreadsheets/d/17wNRmAX9rJn9TeosxJw6-Zb_TMehk4x4/edit?usp=sharing&ouid=100056274406837438527&rtpof=true&sd=true

Discussion –

- Why does it fluctuate at small n?

  At n=100, there are total of 26 complaints. The count of complaints is small that a single extra delayed complainer can shift the estimate by approximately 8 percentage points. The estimate at small n is dominated by sampling noise rather than the underlying probability.

- Observation as number of trial increases? *(AI Answer – reported under AI Prompts)*

  By n=20,000, the standard error is just ±0.0035 — meaning the estimate can only realistically deviate from the true value by about 0.003 to 0.007. Your actual error of 0.0054 falls exactly within this expected range.
  Central Limit Theorem With large n, the distribution of your estimate becomes tightly concentrated around the true value — the bell curve narrows dramatically, making extreme values like 0.65 essentially impossible.

- Managerial implication of the probability P(Delay | Complaint) obtained through the Bayes rule.

  P (D) is 0.10 which means that 1 in 10 orders get delayed on any given day.
  P(D|C) is 0.4375 which means that there is a 43.75% chance that the order was genuinely delayed. It is a strong signal for service failure. It might mean that the manager is ignoring the complaints and not taking any action upon it.

Practical Application -

1. A positive diagnostic test does not mean certainty of disease. If a disease has 1% base rate and the test has 5% false positive rate, it means that most positive results are false positives. Insurance companies use bayes theorem to set premiums based on risk probabilities after health screenings.

2. Spam and fraud detection in applications like Gmail, filter the emails on the basis of Bayesian probability. Each word in an email is checked, words like “win”, “prize”, “click here” raise the probability that it’s a spam email. Similarly, there are many fraud detection systems that update the probability of a fraudulent transaction based on location, amount and timing.

AI Prompts –

Instruction for Claude in the Settings -

You are committed to honesty and accuracy above all else. Follow these rules in every response:

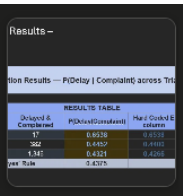

1. UNCERTAINTY - If you are not fully certain about a fact, say so clearly. Use phrases like "I'm not certain, but...", "You should verify this...", or "I may be wrong here, but...". Never state uncertain things as facts.

2. SOURCES - Do not invent paper titles, URLs, or book references. If you cannot name a real, verifiable source, say so. It is better to admit you don't know the source than to fabricate one.

3. STATISTICS & NUMBERS - Flag any statistic you are not 100% confident in. Say "I believe this is approximately..." and recommend the user verify it from an official or primary source.

4. RECENT EVENTS - Remind the user when a topic may have changed since your knowledge cutoff. Do not guess at current events or present outdates info as current.

5. PEOPLE & QUOTES - Never attribute a quote to a real person unless you are certain they said it. If unsure, say "I cannot confirm this quote is accurate."

as an expert in statistical domain, tell me what can you conclude about the uploaded picture and also tell why is there such a large deviation for n=100 and why does probability stabilize around n=20000

Great results table. Here's a full statistical analysis:

What the Results Show

n = 100 → P = 0.6538 (error = 0.2163)

- You got 26 complaints total, 17 of which were from delayed orders
- 17/26 = 0.6538 — nearly 65% chance of delay given complaint
- But the true value is 43.75%, so you're off by 21 percentage points

n = 5,000 → P = 0.4452 (error = 0.0077)

- Error dropped from 0.2163 to 0.0077 — a **96% reduction** just by going from 100 to 5,000 trials
- The estimate is now very close to the theoretical value

n = 20,000 → P = 0.4321 (error = 0.0054)

- Within 0.005 of the true value — nearly exact

Why Such Large Deviation at n = 100?

Three statistical reasons:

1. Too few complaint events With only 100 orders, you expect roughly 16 complaints on average (100 × 0.16). You got 26 — that's already 10 more than expected purely by chance. With such a tiny denominator, even 1-2 extra delayed complainers swings the estimate dramatically.

Write a message...

Why Such Large Deviation at n = 100?

Three statistical reasons:

1. Too few complaint events With only 100 orders, you expect roughly 16 complaints on average (100 × 0.16). You got 26 — that's already 10 more than expected purely by chance. With such a tiny denominator, even 1-2 extra delayed complainers swings the estimate dramatically.

2. High sampling variance Statistical theory tells us the variance of a proportion estimate is P(1-P)/n. At n=100 with P≈0.44:

- Variance = 0.44 × 0.56 / 100 = **0.0025**
- Standard deviation = **±0.05**

This means at n=100, estimates anywhere between 0.34 and 0.54 are within one standard deviation — so 0.65 is well within the range of possible outcomes by chance alone.

3. Compounding randomness Two random draws happen per order — one for delivery outcome, one for complaint. Both can deviate from their true probabilities at small n. If by chance you got more delayed orders AND a higher complaint rate among those delayed orders simultaneously, the estimate inflates significantly — exactly what happened here (26 complaints vs expected 16).

Why Does It Stabilise Around n = 20,000?

Law of Large Numbers (LLN) As n increases, the sample mean converges to the true population mean. This is not just a rule of thumb — it is a mathematical guarantee. The larger the sample, the less influence any single random outcome has on the overall estimate.

Standard error shrinks with √n Standard error = √(P(1-P)/n)

n	Standard Error
100	±0.0500
5,000	±0.0071
20,000	±0.0035

By n=20,000, the standard error is just ±0.0035 — meaning the estimate can only realistically

Why Does It Stabilise Around n = 20,000?

Law of Large Numbers (LLN) As n increases, the sample mean converges to the true population mean. This is not just a rule of thumb — it is a mathematical guarantee. The larger the sample, the less influence any single random outcome has on the overall estimate.

Standard error shrinks with √n Standard error = √(P(1-P)/n)

n	Standard Error
100	±0.0500
5,000	±0.0071
20,000	±0.0035

By n=20,000, the standard error is just ±0.0035 — meaning the estimate can only realistically deviate from the true value by about 0.003 to 0.007. Your actual error of 0.0054 falls exactly within this expected range.

Central Limit Theorem With large n, the distribution of your estimate becomes tightly concentrated around the true value — the bell curve narrows dramatically, making extreme values like 0.65 essentially impossible.

Key Takeaway for the Assignment

The simulation confirms Bayes' Rule empirically. The theoretical value of **0.4375 is not just a mathematical construct** — it is the actual long-run frequency that emerges when you simulate real random orders. The fact that n=20,000 converges to within 0.005 of the theoretical value validates both the simulation design and the Bayes' Rule calculation. This is precisely what Monte Carlo simulation is used for in practice — verifying analytical results through repeated random sampling.

SUMMARY		
	Total Orders	20,000
	Total Complaints	3,115
	Delayed & Complair	1,346
	P(Delay | Complaint	0.4321
	Theoretical (Bayes)	0.4375
	Difference	0.0054

Simulation Results — P(Delay | Complaint) across Trial Sizes

RESULTS TABLE						
Trial Size	**Total Complaints raised by the customers**	**Total Delayed & Complained**	**P(Delay|Complaint)**	**Hard Coded E column**	**Theoretical Values(Bayes)**	**Error (Difference)**
100	26	17	**0.6538**	0.6538	**0.4375**	0.2163
5,000	858	382	**0.4452**	0.4400	**0.4375**	0.0077
20,000	3,115	1,346	**0.4321**	0.4266	**0.4375**	0.0054
Theoretical Value — Bayes' Rule			**0.4375**		—	—
